

IVF Varioflow® – constant flow regulator

IVF

IVFx2

Technical parameters

The IVF constant flow controller is used for automatic flow control for supply or exhaust air. It ensures a constant value of air flow regardless of the pressure conditions in the pipe network.

- for supply and extract
- simple design
- good control characteristics
- simple adjustment of large-scale installations
- low noise level

Construction

The flow controller is made of galvanized steel sheet. Operating temperature -20° to +70°C. The control unit is fixed to the desired flow rate. When the air flow rate increases, the pressure difference in the regulator increases and the damper closes and thus reduce the valve's flow cross-section. This will drop the flow rate back to the original value.

Notice

When designing and installing, care must be taken to ensure that the pressure in the pipe does not exceed 1000 Pa and that the minimum pressure loss corresponds to the loss shown in the diagram. Otherwise the regulator will not perform its function and may be a source of noise.

IVF/IVF-I	600x600	120*	4200	12000

* from dimension B ≥ 400 the constant flow controller is in double IVF x 2 design

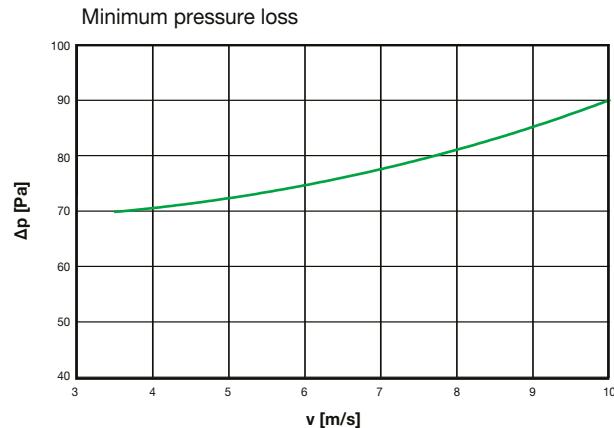

IVF-I

Characteristics

Dependence of air flow rate on velocity
and flow area Setting of the required
constant flow rate only possible for air
velocities of 3.5–10 m/s

 7²

Explanatory notes:

- Q air flow m^3/h , l/s
- v air velocity m/s
- A flow area m^2
- Δp pressure drop (Pa)
