

# VarioflowBOX COMF

energy efficient  
ventilation system

## Technical parameters

### Functions

The box is used for autonomous control of supply and exhaust air to the ventilated space in central ventilation systems.

### Construction

In the galvanized cabinet with removable inspection cover there are two flow controllers for supply and exhaust air to the ventilated space. For connection to the circular duct, the box is equipped with four circular throats, which are fitted with a lip seal. The damper located in the box has class 2 leakage according to EN1751 when closed. The control actuators are equipped with a thermo-anemometric air flow sensor. The box housing is fitted with clamping profiles with four oval holes for wall or ceiling mounting.

### Elektro

Supply voltage 1x230V/50 Hz. The box is equipped with a 230 V/24 V power supply unit with a connection cable terminated with a 230 V plug. The built-in flow regulators are completely connected inside the box with the power supply unit. The air flow through the box can be regulated by an analog 0...10V signal from the remote control or an external humidity, CO<sub>2</sub>, or VOC sensor with an output signal of 0...10V, which can be directly connected to the box's power supply unit (sensors can be powered either 24V or 230V). The regulated amount of air in the supply branch of the box is the same as in the outlet branch of the box (INLET = WATERWAY). Degree of protection of the box IP20.

72

### Mounting

Mounting on the wall or under the ceiling with horizontal or vertical air flow directions. The box can also be mounted in a 600 mm wide furniture cabinet. It is necessary to observe the directions of air flow, which are shown by arrows on the lid of the box and to ensure sufficient access for the possibility of removing the service lid of the box (i.e. in the case of placement in the ceiling, the ceiling must be provided with an inspection hole for easy access to the inspection lid of the box). The bearing capacity of the anchors for wall or ceiling mounting must correspond to the weight of the box.

### Operating conditions

The maximum speed of the flowing air is 5 m/s. Max. the possible pressure difference before and after the flap is 900 Pa. The range of transported air temperatures from 0°C to +50°C. Max. relative humidity of the flowing air up to 95% r.h. (condensation must be prevented on the surface of the box or on the internal components of the box). The air flowing through the box must be free of sticky and abrasive additives to prevent clogging of the sensor of the flow rate sensor and the control valve.

### Accessories

- Remote spatial flow controller CRA24-B3 (with smooth steering) or CRA24-B1P (3 flow rates).
- MAA silencer
- MTS silencer
- SONOULTRA flexible silencer
- SPIRO circular pipe
- SEMIFLEX SONO soundproof hose

### Type key for ordering

VarioflowBOX COMF	1	0	0	-	I
	1	2			

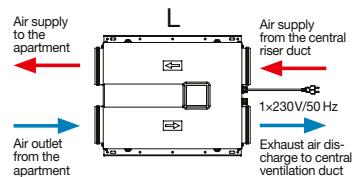

1 – box size:

100, 125, 150, 160

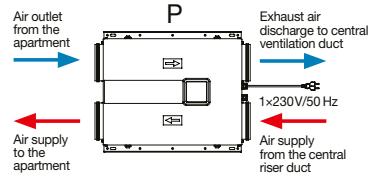

2 – implementation:

- S = standard box design without internal branch insulation
- I = box with internal insulation of the inlet and outlet branches with Armaflex insulation

## Characteristics

### Box pressure loss

The following box pressure drop curve applies to the box with the flow regulator flap open.  
 The pressure loss of the inlet and outlet parts is the same.

### Noise data

Noise data are given at different pressure differences on the flap of the built-in VarioflowBOX flow regulator.

$L_w$  (dB) sound power level into the supply or exhaust pipe in octave bands

$L_{WA}$  (dB(A)) acoustic power level to the inlet or outlet pipe corrected by filter "A" (applies to one branch of the VarioflowBOX).

$\Delta p$  (Pa) static pressure difference before and after the VarioflowBOX (measured on one branch – inlet or outlet)

$\Delta p_{min}$  (Pa) minimum static pressure difference before and after the VarioBOX (during operation of the VarioBOX flow regulator flap)
